Step 1: Data Repartition
Train Dataset $\mathcal{D}$
Small Proxy Model
Gradient Vector
Random Projection
K-means Cluster
$\mathcal{D}_1$
$\mathcal{D}_2$
$\mathcal{D}_k$
Step 2: Domain Impact Matrix
$\mathcal{D}_1$ 0.07 0.12 ... 0.26
$\mathcal{D}_2$ 0.05 0.09 ... 0.03
$\mathcal{D}_k$ 0.19 -0.06 ... 0.11
S_1 S_2 ... S_m
Downstream Tasks $\mathcal{S}$
$I(D_i, S_j)$
$KL\left[p(x|\theta+\nabla\ell_{D_i}) \,\|\, p\left(x\middle|\theta+\nabla\ell_{S_j}\right)\right]$
$\approx \frac{1}{2}\left(\nabla\ell_{S_j}-\nabla\ell_{D_i}\right)^T F\left(\nabla\ell_{S_j}-\nabla\ell_{D_i}\right)$
$F \approx \mathbb{E}([\nabla \log p(x|\theta) \odot \nabla \log p(x|\theta)])$
Step 3: Update Sampling Vector
Last Mixture p_{t-1}
Updated Mixture p_t
$p_{t,i} = softmax\left(\frac{\sum_j I(D_i,S_j) * (l_c + l_p)}{p_{t,i-1}}\right)$
